# PRÉFACE.

L'Association scientifique de France, à la suite d'un Rapport présenté au Conseil par M. Belgrand, a résolu, en 1871, d'entreprendre la publication d'un *Bulletin météorologique* dont la plus grande partie devait être consacrée à donner jour par jour la hauteur d'eau tombée dans un grand nombre de stations répandues sur toute la surface de la France et les variations de niveau des cours d'eau. Le but principal de cette publication était de rassembler les observations relatives au régime naturel des eaux et d'étendre aux différents bassins de notre pays les études commencées en 1854 sur le bassin de la Seine.

Les travaux de M. Belgrand avaient déjà mis en évidence plusieurs lois remarquables sur le régime des pluies et permis d'établir les règles qui servent de guide pour la prévision des crues de la Seine. Un service analogue d'annonces de crues, basé sur les mêmes principes, est établi maintenant pour les principales rivières; c'est un véritable bienfait, dont les populations riveraines connaissent tout le prix.

Un grand nombre d'observateurs isolés, de Sociétés et d'établissements publics ont prêté leur concours à cette œuvre commune; l'Administration des Ponts et Chaussées et l'Administration des Forêts y ont contribué pour une large part, en faisant installer des pluviomètres dont l'observation était confiée à leurs agents, et M. le Ministre des Travaux publics a bien voulu venir en aide à l'Association scientifique par une subvention importante. D'ailleurs, l'utilité de ces recherches a été tellement comprise, que le nombre des stations, qui était de 303 au début, s'est élevé à 646 à la fin de la première année.

Le *Bulletin météorologique* de l'Association scientifique de France était dirigé par M. Belgrand, avec la collaboration de M. G. Lemoine et le concours de M. Rayet, puis de M. Fron. Il commence au 1$^{er}$ décembre 1871, et les trois premiers volumes sont ainsi rapportés à l'année dite météorologique; à partir de 1875, au contraire, on a suivi l'année civile. Il n'a pas semblé que pour l'étude de la pluie et des cours d'eau il fût nécessaire de choisir une autre date de départ que le 1$^{er}$ janvier.

Malheureusement la mort de M. Belgrand vint mettre une entrave à la publication du *Bulletin*. Les derniers volumes, qui s'arrêtent à la fin de l'année 1876, ont été achevés par ses collaborateurs; mais, le nombre des stations ayant augmenté

dans de grandes proportions, l'Association scientifique a pensé qu'elle ne pouvait continuer de soutenir une entreprise qui devenait trop onéreuse pour elle et que, sans cesser de donner des encouragements aux travaux de Météorologie, elle devait laisser le soin de cette publication spéciale à une administration qui disposât d'un personnel suffisant.

Le Bureau central météorologique a accepté la mission de publier les observations pluviométriques, qui rentrent dans le cadre de ses études, et, à la suite d'une demande présentée par M. Lalanne, Directeur de l'École des Ponts et Chaussées et du service hydrométrique du bassin de la Seine, M. le Ministre des Travaux publics a décidé que la subvention accordée à l'Association scientifique serait reportée au Bureau central météorologique. L'œuvre fondée par M. Belgrand a désormais un avenir assuré.

Des raisons de service nous ont décidé à publier d'abord les observations de l'année 1878, pour laquelle les documents étaient plus faciles à rassembler, nous réservant de donner ensuite, comme nous le faisons aujourd'hui, les observations de l'année 1877, afin de ne pas laisser de lacune entre les publications de M. Belgrand et celles qui seront comprises dans les *Annales* du Bureau central météorologique.

Les observations de l'année 1877 comprennent environ 900 stations; celles de 1878 atteignaient déjà 1100. Grâce au concours de l'Administration des Ponts et Chaussées, de l'Administration des Forêts et des Commissions départementales, avec les documents fournis par les Observatoires, les Écoles normales et tous nos correspondants isolés, nous pouvons espérer que le nombre des stations croîtra rapidement d'année en année, que certaines lacunes ne tarderont pas à disparaître et que la pluie en France sera l'objet d'une étude approfondie.

Nous avons ajouté aux observations elles-mêmes des résumés trimestriels et des résumés annuels; en outre, cinq Cartes placées à la fin du volume permettront d'apprécier d'un coup d'œil la distribution des pluies pendant chaque trimestre et pendant l'année entière. Enfin M. Moureaux, qui dirige ce travail avec beaucoup de zèle, y a ajouté une Revue sur le caractère de l'année.

Je dois, en terminant, exprimer tous mes remercîments à M. G. Lemoine, qui nous a aidés avec une extrême obligeance dans les débuts d'une organisation un peu difficile, et dont la compétence spéciale pour ce genre de travaux nous a été d'un grand secours.

Paris, le 15 décembre 1880.

*Le Directeur du Bureau central météorologique,*

E. MASCART.

SUR LE

# RÉGIME DES PLUIES EN FRANCE

## PENDANT L'ANNÉE 1877,

PAR M. TH. MOUREAUX,

Météorologiste-Adjoint au Bureau central météorologique.

### Introduction.

*Publication des observations.* — Les observations relatives aux pluies tombées en France pendant l'année 1877 sont publiées, sauf quelques modifications de détail, selon la méthode établie par M. Belgrand et adoptée pour le *Bulletin météorologique de l'Association scientifique.*

La France a été divisée en quatre grandes régions naturelles, correspondant aux quatre versants de la mer du Nord, de la Manche, de l'Océan et de la Méditerranée; les versants ont été subdivisés en bassins principaux, et chaque bassin principal en bassins secondaires.

Le nombre des stations a augmenté dans de notables proportions; aux observations faites sous la direction de MM. les ingénieurs des Ponts et Chaussées, sont venus s'ajouter les documents adressés directement à l'Observatoire de Paris, puis au Bureau central météorologique. C'est ainsi que certains départements, les Bouches-du-Rhône, la Creuse, le Pas-de-Calais, les Deux-Sèvres, etc., se trouvent représentés cette année pour la première fois par un réseau important de points d'observation.

Le Tableau suivant indique pour chaque division le nombre de stations dont nous publions les résultats :

## Nombre des stations en 1877.

*Versant de la mer du Nord.*

| | Stations. |
|---|---|
| Bassins du Rhin, de la Meurthe et de la Moselle | 29 |
| Bassins de la Meuse, du Chiers et de la Sambre | 15 |
| Bassins de l'Escaut, de la Lys, de l'Yser et de l'Aa | 22 |

*Versant de la Manche.*

| | |
|---|---|
| Bassins de la Canche, de la Somme, de la Béthune, etc | 27 |
| Bassin de la Seine : | |
| Bassin de l'Yonne | 38 |
| » de la Marne | 25 |
| » de l'Aisne | 14 |
| » du Loing | 11 |
| Région de la Beauce et bassin de l'Eure | 20 |
| Bassin de l'Oise | 15 |
| » de la Seine supérieure | 22 |
| » de la Seine, entre Montereau et Paris | 11 |
| » de la Seine inférieure, au-dessous du confluent de l'Oise | 17 |
| Bassins entre la Seine et la pointe de Bretagne : | |
| Bassins de la Touque, de la Dive, de l'Orne, de la Vire et de la Rance | 23 |

*Versant de l'Océan.*

| | |
|---|---|
| Petits bassins du sud de la Bretagne | 28 |
| Bassin de la Vilaine | 29 |
| Bassin de la Loire : | |
| Bassin de la Loire supérieure | 36 |
| » de l'Allier | 30 |
| » de la Loire, du Bec-d'Allier à Angers | 34 |
| » du Cher | 23 |
| » de la Creuse | 14 |
| » de l'Indre | 13 |
| » de la Vienne | 20 |
| » du Loir | 30 |
| » de la Sarthe | 37 |
| » de la Mayenne | 10 |
| » de la Loire inférieure | 17 |
| Bassins entre la Loire et la Gironde : | |
| Bassins de la Sèvre niortaise et de la Vie | 14 |
| Bassin de la Charente | 18 |
| Bassin de la Gironde : | |
| Bassin de la Dordogne | 19 |
| » du Lot | 16 |
| » de l'Aveyron | 5 |
| » du Tarn | 17 |
| » de la Garonne, cours supérieur, et affluents des Pyrénées | 15 |
| » de la Garonne (R. G.) au-dessous de Toulouse; bassins du Gers et de la Baïse; bassin de la Gironde | 21 |
| Bassins entre la Gironde et les Pyrénées : | |
| Petits bassins entre la Gironde et l'Adour | 2 |
| Bassin de l'Adour | 19 |
| A reporter | 756 |

*Versant de la Méditerranée.*

| | Stations. |
|---|---|
| Report..... | 756 |
| Bassins entre les Pyrénées et le Rhône : | |
| Bassins de l'Agly, de la Tet et du Tech..... | 16 |
| Bassin de l'Aude..... | 25 |
| Bassins du Vidourle, du Lez, de l'Hérault et de l'Orb..... | 17 |
| Bassin du Rhône : | |
| Bassin de la Saône..... | 48 |
| » du Doubs..... | 4 |
| » du Rhône proprement dit, cours moyen..... | 31 |
| » du Rhône proprement dit, cours inférieur..... | 52 |
| Région de Nice : | |
| Petits bassins entre le Rhône et les Alpes..... | 31 |
| Corse..... | 1 |
| Total..... | 981 |

La répartition de ces stations est très inégale; nombreuses dans certaines régions, telles que les bassins de la Seine, de la Loire, de la Vilaine, de l'Aude, du Rhône inférieur, dans la région au nord du bassin de la Seine, etc., elles sont encore insuffisantes dans les Alpes, le Jura, la Manche, la région du Sud-Ouest, etc.

La pluie est de sa nature un phénomène dont la mesure exacte présente quelque difficulté, et les nombres qui expriment les épaisseurs de la tranche d'eau recueillie en un lieu peuvent différer notablement en deux points rapprochés l'un de l'autre, selon différentes causes locales, telles que l'emplacement du pluviomètre, ses dimensions, sa hauteur au-dessus du sol, et aussi suivant le soin apporté aux observations, en sorte qu'il n'y a pas grand inconvénient à exprimer en millimètres ronds les hauteurs d'eau recueillies chaque jour, surtout si l'on songe que le maintien de la décimale serait un obstacle considérable à la publication des observations quotidiennes.

Nous avons donc, comme dans le *Bulletin météorologique*, continué à exprimer ces quantités en nombres ronds de millimètres; toutefois le total mensuel est en chaque cas, non pas la somme des nombres inscrits aux différentes dates dans les Tableaux, mais la somme exacte des pluies partielles consignées par les observateurs, et qui sont le plus souvent exprimées en millimètres et en dixièmes de millimètre. Lorsque la hauteur d'eau recueillie s'est trouvée inférieure à $0^{mm},5$, on l'a représentée par un zéro; un point indique qu'il n'est pas tombé d'eau. Enfin on a laissé en blanc les dates correspondant aux lacunes. Ajoutons que les observations sont faites à $8^h$ ou $9^h$ du matin et que le nombre inscrit à une date donnée représente généralement la pluie tombée depuis la veille.

Pour faciliter la comparaison des saisons entre elles et avec l'année, nous avons résumé, à la suite des Tableaux mensuels, les observations de chaque trimestre et celles de l'année entière. L'altitude des stations est indiquée dans

la première colonne de ce Tableau résumé; lorsque cette donnée a été fournie par l'observateur, on l'a notée telle quelle; pour les stations dont la hauteur du pluviomètre au-dessus du niveau de la mer n'est pas connue d'une manière précise, nous donnons, à titre de renseignement, les cotes inscrites sur la Carte de l'État-Major. Ces derniers nombres, qui représentent l'altitude du lieu et non celle du pluviomètre, comportent nécessairement quelque incertitude; pour les distinguer des premiers, on les a fait suivre d'un astérisque.

*Construction des Cartes.* — La publication *in extenso* des observations pluviométriques est certainement très précieuse pour les recherches spéciales que l'on peut se proposer, soit au point de vue hydrographique, soit au point de vue agricole, mais les Tableaux numériques sont généralement difficiles à consulter; en tout cas, ils ne permettent pas, aussi facilement que leur représentation graphique, de saisir d'un coup d'œil les phénomènes dont ils sont l'expression, et leur examen devient d'autant plus difficile que les observations sont plus nombreuses.

Afin de rendre plus sensible à l'œil l'ensemble de la distribution relative des pluies en France, nous avons construit, à l'aide des nombres inscrits dans le Tableau résumé, les cinq Cartes insérées à la fin du présent Volume. Les Cartes n° 1 à n° 4 sont relatives à chacun des trimestres de 1877; la cinquième fait connaître la distribution des pluies pendant l'année entière. Nous les étudierons séparément plus loin.

Disons seulement que les courbes qui limitent les teintes figurées passent approximativement par les points où la quantité d'eau tombée est la même; elles sont tracées de $100^{mm}$ en $100^{mm}$ pour les Cartes trimestrielles et de $200^{mm}$ en $200^{mm}$ pour la Carte annuelle. A l'aide des documents publiés à l'étranger, elles ont pu être prolongées sur les pays compris dans les limites du cadre. Nous avons utilisé les publications de l'Observatoire de Bruxelles, de l'Observatoire fédéral suisse, du Bureau météorologique central d'Italie, de l'Observatoire de Moncalieri et du Bureau statistique de Berlin. Pour l'Angleterre, nous nous sommes servi des nombres recueillis et publiés par M. Symons.

Ces Cartes ne comportent évidemment pas une exactitude rigoureuse, surtout dans les régions signalées comme insuffisamment pourvues de postes d'observation; toutefois, elles donnent une idée générale des phénomènes et font ressortir nettement les relations qui existent entre l'épaisseur de la tranche d'eau tombée et les causes qui favorisent les chutes de la pluie, et dont les principales sont le voisinage de la mer, la situation topographique par rapport aux vents pluvieux, et surtout l'altitude.

## Premier trimestre de 1877.

L'année 1877 a été extrêmement humide à son début, et les pluies tombées pendant les trois mois de janvier, février et mars sont presque partout en excès sur la moyenne. Cette période constitue du reste une des saisons les plus douces qui aient été observées depuis longtemps, au moins dans le nord de la France, et à Paris il faut remonter jusqu'en 1819 pour trouver une température moyenne aussi élevée.

Sur les versants de la mer du Nord et de la Manche, dans les bassins du sud de la Bretagne et sur les affluents de la rive droite de la Loire, le premier trimestre de 1877 est celui pendant lequel il est tombé les plus grandes quantités d'eau; seules les pluies de février sont restées faibles dans le midi de la France.

*Janvier.* — Le régime des basses pressions est établi sur l'Europe occidentale pendant toute la première quinzaine de ce mois. Les pluies se groupent principalement du 4 au 6, du 11 au 12, et vers le 15; elles s'étendent à toute la France, sauf sur le versant de la mer du Nord. Les vents du Sud-Est, qui soufflent du 4 au 10 dans le Midi, amènent sur le versant méridional des Cévennes des pluies abondantes qui atteignent jusqu'à 280$^{mm}$ vers la source de l'Ardèche.

Quelques pluies légères tombent encore du 17 au 19 dans les bassins de la Seine et de la Loire; mais, à partir du 20, les hautes pressions apparaissent en France, où elles persistent jusqu'au 25 : c'est dans cet intervalle que se produit à Paris la température minima absolue du mois.

Sous l'influence d'une bourrasque dont l'action s'étend sur toute l'Europe occidentale, les pluies sont générales dans la journée du 26; plus faibles et plus localisées le 27, elles reprennent le 28 pour se prolonger jusqu'au 31. Ce dernier groupe est le plus important du mois dans les bassins du Rhin, de la Moselle et de la Meuse, où les pluies sont chassées par des vents de l'Ouest ou du Nord-Ouest, commandés par les faibles pressions qui couvrent les contrées du Nord et l'Europe centrale.

Les pluies de janvier sont réparties sur un grand nombre de jours dans les régions maritimes du versant de la Manche, dans les petits bassins entre la Seine et la Loire et sur les affluents de la rive droite de la Loire; on en compte de dix-huit à vingt-deux dans les bassins de la Sarthe et de la Mayenne, vingt-deux à vingt-quatre en Bretagne, et jusqu'à vingt-six dans les stations de la Seine inférieure. Au contraire, dans les régions montagneuses, les jours de pluie sont moins nombreux et les groupes pluvieux mieux définis; il en est de même dans le bassin du Rhône et sur la côte de la Méditerranée.

Les plus fortes pluies du mois sont tombées sur le versant méridional des

Cévennes, sur la Montagne Noire, les monts d'Auvergne, le haut Morvan, au sommet des Vosges, et sur les régions maritimes du nord et du nord-ouest de la France; les plus faibles ont été recueillies dans les vallées de la Saône, du Rhône, et sur le littoral de la Méditerranée.

*Février.* — L'allure générale du temps ne se modifie guère pendant le mois de février, au moins dans tout le pays situé au nord du plateau central. Les faibles pressions qui persistent sur l'Europe occidentale maintiennent en France le régime des vents chauds et humides du Sud-Ouest, et les pluies sont pour ainsi dire constantes; elles sont très fortes du 12 au 14 sur le versant de la mer du Nord, vers les régions supérieures des bassins de la Seine, de la Loire, de la Saône et sur les montagnes de la Savoie.

Du 20 au 22, une forte bourrasque, venue par la mer du Nord, traverse l'Europe du Nord-Ouest au Sud-Est : le 20, une tempête de Nord-Ouest règne sur toutes nos côtes. Les pluies s'étendent aux diverses régions situées au nord des Cévennes; dans le Midi elles sont très faibles. Un nouveau groupe de pluies ou de neiges est encore signalé du 24 au 27, et le 28 les vents du Nord et les hautes pressions dominent en France.

Le caractère pluvieux du mois de février se manifeste surtout par le grand nombre de jours de pluie plutôt encore que par les hauteurs d'eau recueillies. On en compte vingt à vingt-quatre sur le versant de la mer du Nord et dans les bassins de la Somme et de la Seine, dix-huit à vingt-deux dans les bassins de la Loire et de la Dordogne, neuf à douze dans les bassins de la Garonne et de l'Adour, deux à quatre dans le cours inférieur du Rhône, et un seulement dans la région de Nice. Les plus fortes pluies de ce mois s'étendent sur une zone qui comprend tout le versant de la mer du Nord, le Morvan, le plateau de Langres, les Vosges, le Jura, les montagnes du Beaujolais et de la haute Savoie. Un maximum très accentué se montre également dans le département de la Seine-Inférieure et dans le bassin de la Somme; enfin d'autres maxima, plus circonscrits, couronnent le plateau de Lannemezan, le mont Dore et la Montagne Noire. Au contraire les pluies sont faibles sur les Cévennes, dans la vallée de la Saône, dans le bassin du Rhône inférieur et de ses affluents. La hauteur d'eau tombée est insignifiante ou nulle dans les petits bassins des Pyrénées-Orientales, dans l'Hérault, vers l'embouchure du Rhône et sur les Alpes maritimes.

*Mars.* — Le mois de mars est également caractérisé par des pluies abondantes et par une température relativement douce.

Les hautes pressions signalées le 28 février se maintiennent sur la France pendant les premiers jours du mois; mais à partir du 5 mars, et jusqu'au 9, la

pluie ou la neige tombent de nouveau, sous l'influence d'un centre de basses pressions situé dans l'Est.

Le baromètre remonte le 10 et se tient élevé jusqu'au 16. On ne remarque, pendant cette période, que de faibles pluies locales disséminées sur divers bassins.

Les pluies les plus abondantes se rattachent à une bourrasque venue des Açores, et dont le centre passait sur les Pyrénées le 19, vers Rochefort le 20 et sur le Pas-de-Calais le 21. Les bourrasques de cette origine sont généralement, en hiver, précédées par une élévation de température. Lorsque l'air chaud et humide qu'elles entraînent se refroidit au contact des continents, il se produit des condensations énergiques. Aussi, dans le cas actuel, des pluies très intenses s'étendent aux diverses régions de la France. Le bassin de la Garonne est pourtant à peu près épargné, en raison de sa situation par rapport à la direction des vents pluvieux, les masses nuageuses ayant vraisemblablement dépouillé une grande partie de leur humidité sur le versant méridional des Pyrénées.

Une autre perturbation, ayant son centre le 22 sur la Méditerranée, amène des pluies sur les Cévennes et dans la région du Midi.

Le 25, une dépression profonde et très étendue, dont le centre se trouve à l'entrée de la Manche, existe sur le nord-ouest de l'Europe, où elle persiste pendant plusieurs jours : des pluies générales tombent encore en France.

La présence prolongée d'une zone de basses pressions sur l'Océan Atlantique implique fréquemment pour le Midi le régime des vents du Sud-Est, qui apportent l'air chaud et humide de la Méditerranée. Dans le cas actuel, les pluies sont tombées pendant huit jours consécutifs dans le bassin inférieur du Rhône et sur les Alpes maritimes.

Le nombre des jours de pluie, d'ailleurs élevé partout, est très variable : on en compte vingt-quatre à vingt-six sur le versant de la mer du Nord, vingt-deux à vingt-quatre dans les bassins de la Seine et de la Saône, seize à vingt dans le bassin de la Loire, dix à douze dans le cours inférieur du Rhône, et six à dix dans la région de Nice.

Comme en février, les totaux les plus importants sont encore relevés dans l'Est : sur les Vosges, le Jura, le Morvan, le plateau de Langres, en Savoie. La vallée de la Saône, où se trouve généralement un minimum de pluie, reçoit elle-même plus de $100^{mm}$ d'eau. Des maxima apparaissent encore sur les collines de la Normandie et de la Bretagne, sur le plateau central, les monts de la Lozère, la Montagne Noire, vers le golfe de Gascogne et sur les Alpes maritimes. La répartition des pluies est très uniforme dans les régions basses du bassin de la Seine et du versant de l'Océan. Le minimum absolu se trouve sur les petits bassins des Pyrénées orientales.

*Carte n°* 1. — La Carte n° 1 montre la distribution des pluies à la surface de la France pendant le premier trimestre de l'année 1877. Le maximum absolu (668$^{mm}$) a été relevé dans les Vosges, sur le versant occidental du ballon de Servance; on trouve ensuite des maxima de 666$^{mm}$ au sommet du Morvan, 655$^{mm}$ dans les Basses-Pyrénées, vers les sources du gave d'Aspe, 531$^{mm}$ sur le massif du Jura, 514$^{mm}$ sur la Montagne Noire, 469$^{mm}$ sur le versant méridional des Cévennes. Des maxima supérieurs à 300$^{mm}$ se rencontrent encore sur les montagnes du Forez et du Cantal, sur le plateau de Langres, les Ardennes, les collines de l'Artois, de la Normandie et de la Bretagne.

Le minimum absolu s'étend sur les régions basses des petits bassins situés entre les Pyrénées et le Rhône; là il est tombé moins de 50$^{mm}$ d'eau. Dans la vallée inférieure du Rhône au-dessous d'Orange, les hauteurs de pluie sont comprises entre 50$^{mm}$ et 100$^{mm}$. Des minima relatifs se montrent aussi dans les vallées du haut Allier, de la Saône, du Rhin entre Bâle et Strasbourg, dans le bassin moyen de la Garonne et vers le lac de Genève; le minimum de la vallée de l'Allier est le plus accentué : il correspond à une quantité d'eau inférieure à 100$^{mm}$. Dans le bassin de Paris et sur la plus grande partie du versant de l'Océan, la tranche d'eau est assez uniforme et voisine de 200$^{mm}$.

### Deuxième trimestre de 1877.

La distribution des pluies pendant les mois d'avril, mai et juin présente de grandes inégalités : ainsi, tandis que cette saison est la plus sèche de l'année 1877 dans les régions du nord de la France, elle est au contraire la plus humide dans le bassin supérieur de la Loire, dans les bassins de la Gironde et de l'Adour, et sur tout le versant de la Méditerranée.

*Avril.* — La période pluvieuse qui a caractérisé la précédente saison se continue encore pendant tout le mois d'avril. Un premier groupe de pluies commence le 3 et se prolonge presque sans interruption jusqu'au 11, en même temps qu'une série de dépressions se succèdent sur l'Europe occidentale. Sou l'influence d'une dépression secondaire venue par le golfe de Gascogne, des pluies torrentielles tombent le 9 et le 10 sur le versant méridional des Cévennes et sur le littoral de la Méditerranée.

Le baromètre remonte à partir du 12, et jusqu'au 15 la pression en France, très uniforme, est voisine de la normale; les pluies sont à peu près nulles.

Du 17 au 20, une forte bourrasque traverse la France du Nord-Ouest au Sud-Est. Les pluies générales, torrentielles, prolongées, causées par cette bourrasque, ont fourni un appoint considérable au total des pluies du mois. Pendant trois

jours consécutifs, un courant du Nord-Ouest nettement accusé produit, principalement dans nos régions de l'Ouest, des condensations d'une énergie exceptionnelle.

Après quelques jours d'un temps plus sec, les basses pressions apparaissent de nouveau dans l'Ouest, et, pendant les trois derniers jours du mois, les pluies sont de nouveau générales en France.

Le nombre des jours pluvieux est de dix-huit à vingt sur le versant de l'Océan, seize à dix-huit sur le versant de la Manche, douze à quinze sur le versant de la Méditerranée, et dix à douze seulement sur le versant de la mer du Nord.

La distribution des pluies de ce mois diffère sensiblement de celle des mois précédents. On retrouve bien encore, sur les sommets élevés des Vosges, du Morvan, du Forez, des monts de la Lozère, de la Montagne Noire, etc., des maxima, du reste peu accentués et très circonscrits, mais, tandis qu'en mars, et surtout en février, les plus grandes pluies tombent dans les régions montagneuses de l'Est, en avril, au contraire, ce sont les plaines de l'Ouest qui reçoivent les quantités d'eau les plus considérables : un maximum très étendu couvre presque tout le versant de l'Océan, sauf la vallée de la Garonne et celle de la Loire proprement dite. Cette distribution particulière des pluies d'avril est due à l'influence de la bourrasque du 17.

Notons encore que les quantités de pluie les plus faibles sont tombées non seulement sur le littoral de la Méditerranée, mais aussi dans tout le nord de la France.

*Mai.* — Le caractère général du temps ne se modifie pas. Une dépression barométrique se forme le 3 vers le golfe de Gascogne; elle se creuse progressivement le 4 et le 5, en même temps qu'elle se transporte très lentement vers l'Est en traversant la France. Puis d'autres dépressions se succèdent sur l'Océan et maintiennent une longue période de pluie qui s'étend du 5 au 15 dans les bassins du Rhône et de la Gironde, du 5 au 21 sur les affluents de la rive droite de la Loire, du 9 au 20 en Bretagne et sur le versant de la mer du Nord, du 9 au 23 dans le bassin de la Seine.

Du 23 au 27, le régime des fortes pressions succède à cette période troublée, et les pluies sont rares et insignifiantes.

Le 28, une perturbation profonde et d'une grande étendue commande le temps sur toute l'Europe occidentale, depuis le Portugal jusqu'à la Norvège, et ramène une nouvelle période pluvieuse, qui se prolonge jusqu'à la fin du mois.

Les totaux de pluie tombée pendant ce mois sont partout supérieurs à la normale; les plus élevés sont signalés dans les régions montagneuses du Centre jusqu'à la Montagne Noire, et dans l'Est sur le plateau de Langres, les Vosges, le Jura, les Alpes, etc. Le minimum absolu, au-dessous de $50^{mm}$, se retrouve, comme d'habitude, dans les petits bassins entre les Pyrénées et le Rhône.

Dans la région basse du Nord, dans le bassin de Paris, le bassin moyen de la Loire et dans la vallée du Rhône au-dessous de Valence, les hauteurs totales de ce mois sont comprises entre $50^{mm}$ et $100^{mm}$.

*Juin.* — Le 1er juin est encore un jour de pluie, mais dès le 2 la situation atmosphérique se modifie profondément; le baromètre remonte peu à peu sur les côtes de l'Europe occidentale : le temps se met au beau. Tandis que mai avait été extrêmement pluvieux et que sa température moyenne était restée au-dessous de la normale, juin au contraire a une température exceptionnellement élevée; de plus, c'est un mois sec.

Du 7 au 10, une zone de hautes pressions s'étend sur la France; peu à peu l'équilibre atmosphérique s'établit sur l'Europe occidentale; la pression devient plus uniforme, et cette uniformité persiste jusqu'au 22. Pendant toute cette période, on n'a à signaler que des pluies orageuses locales, tombées principalement dans le bassin de la Loire.

Le 22 et le 23, une dépression isolée qui passe sur les îles Britanniques, étend son action jusqu'à nos régions, et des pluies, les seules du reste qui aient quelque importance, tombent presque partout en France. Enfin, depuis le 24 jusqu'à la fin du mois, l'Europe est soumise au régime des hautes pressions, lesquelles sont généralement accompagnées de beau temps.

On compte douze à quinze jours de pluie dans le bassin de la Saône, huit à douze en Bretagne, dans le bassin de la Seine et sur le versant de l'Océan, sept à neuf sur le versant de la mer du Nord et dans le cours inférieur du Rhône, quatre à six vers la Méditerranée.

Les pluies de juin n'ont atteint un total supérieur à $100^{mm}$ que sur les hautes Pyrénées, dans le bassin de la Garonne supérieure et de ses affluents de la rive gauche, sur la rive droite de la Saône jusqu'au plateau de Langres, au sommet des Vosges, sur la Méditerranée et vers la source de l'Yonne.

Elles sont inférieures à $25^{mm}$ dans le bassin de Paris, sur la côte de l'Océan, dans la vallée du Rhône en aval de Lyon, et sur les Alpes maritimes où se trouve le minimum absolu.

*Carte n°* **2.** — L'excès de pluie tombée pendant le deuxième trimestre de l'année 1877 s'étend principalement sur les régions montagneuses du Centre et du Sud-Ouest, et sur le versant de la Méditerranée.

Le maximum absolu ($689^{mm}$) se montre sur le Jura. On trouve des maxima de $639^{mm}$ sur les montagnes de la haute Savoie, de $549^{mm}$ dans les monts de la Lozère, entre $400^{mm}$ et $500^{mm}$ sur le versant occidental des Alpes, sur les monts du Cantal, au mont Dore, sur les montagnes du Forez, la Montagne Noire, les hautes Pyrénées, et dans l'Est au sommet du Morvan et des Vosges. Des maxima relatifs, d'ail-

leurs limités, se montrent encore sur les collines de l'Artois, de la Seine inférieure et de la Bretagne.

Dans le bassin de Paris, vers les Ardennes, dans la Manche, le Morbihan, la vallée supérieure de l'Allier, la pluie est voisine de 200$^{mm}$. Le minimum le plus important s'étale encore le long de la côte de la Méditerranée.

### Troisième trimestre de 1877.

Les trois mois de juillet, août et septembre 1877 constituent la période la plus sèche de l'année, excepté dans la région du Nord, où les plus faibles pluies sont tombées pendant la saison précédente.

*Juillet.* — Pendant la période du 1$^{er}$ au 12 juillet, les dépressions barométriques passent dans les régions septentrionales de l'Europe; on ne signale en France que des pluies orageuses, groupées principalement autour du 1$^{er}$, du 5 et du 6.

Le courant équatorial se rapproche ensuite de nos côtes, et le 13 une dépression profonde apparaît nettement à l'ouest de l'Irlande; son centre reste stationnaire plusieurs jours sur les îles Britanniques; elle s'éloigne enfin le 18 par la mer Baltique. Pendant toute cette période, les pluies tombent dans les différentes régions de la France, sauf sur le littoral de la Méditerranée. Elles apparaissent d'abord en Bretagne, et sont abondantes du 13 au 15 dans la région comprise entre les bassins de la Seine et de la Loire, et dans la vallée de la Loire proprement dite. Dans les régions de l'Est, sur le plateau de Langres, les Vosges, dans le bassin de la Saône, sur les montagnes de la Savoie, elles tombent en moyenne à partir du 15 pour se prolonger jusque vers le 20.

Les pluies cessent à cette date, mais dès le 23 une autre dépression apparaît, comme la précédente, à l'ouest des îles Britanniques; son action s'étend jusqu'à la France; elle amène un nouveau groupe de pluies et d'orages qui persistent jusqu'au 27.

Les basses pressions s'éloignent alors dans le Nord, et le temps est très beau pendant les derniers jours du mois.

Les jours pluvieux sont au nombre de douze à quinze sur les versants de la mer du Nord et de la Manche, dix à quatorze sur le versant de l'Océan, dans le bassin de la Saône et le cours moyen du Rhône, cinq à sept sur le littoral de la Méditerranée.

Les plus grandes quantités d'eau reçues pendant le mois de juillet se trouvent dans l'Est : sur le Morvan, le plateau de Langres, les Vosges, le Jura, les Alpes du Dauphiné et de la Savoie. Dans toutes ces régions, les totaux de pluie sont supé-

rieurs à 100$^{mm}$; le maximum absolu (274$^{mm}$) est relevé au col des Gets, dans la Haute-Savoie. Des maxima relatifs se montrent encore vers les sources de l'Aisne, de la Mayenne et de la Sarthe, en Bretagne, sur le plateau de Gatine, les montagnes du Forez, le mont Dore, au golfe de Gascogne et vers la haute Garonne.

Le minimum absolu, comprenant les pluies inférieures à 25$^{mm}$, longe la côte méditerranéenne; des minima relatifs se montrent ensuite dans les vallées de la Saône, du Cher, dans celle de la Loire proprement dite au-dessous de Tours, et dans les petits bassins entre la Gironde et l'Adour.

*Août.* — Les vents des régions Nord dominent en France pendant les premiers jours du mois d'août; les pluies sont rares jusqu'au 6. A cette date, une dépression importante apparaît à l'ouest des îles Britanniques; elle marche lentement vers le Nord-Est; c'est seulement le 11 qu'elle s'éloigne par la Norvège. Tout le pays au nord du plateau central reçoit de l'eau pendant cette période; la pluie tombe du 7 au 10 sur la région du Nord-Ouest et dans le bassin de la Meuse; dans le bassin de la Seine, sur la rive gauche de la Loire, et même sur le versant de la Méditerranée, de fortes pluies tombent dans la journée du 8. Quelques pluies d'orages sont ensuite signalées du 14 au 16, principalement dans le bassin de la Loire supérieure; puis, la hausse du baromètre survenant, le temps se tient au beau jusqu'au 20.

Une dépression se montre à cette date sur l'Irlande; son centre passe le 21 sur le nord de l'Angleterre et s'éloigne ensuite vers les hautes latitudes; des pluies orageuses tombent du 20 au 22, principalement le 21. Le beau temps reprend ensuite, interrompu seulement vers le 26 par des pluies d'orages; il se prolonge jusqu'à la fin du mois.

On compte quinze à dix-huit jours de pluie sur le versant de la mer du Nord, huit à douze dans les bassins de la Seine et de la Loire, six à dix dans les bassins de la Gironde, de la Saône et dans le cours moyen du Rhône, et seulement deux à quatre sur la Méditerranée.

Les pluies tombées pendant le mois de juillet sont faibles. Les quantités supérieures à 100$^{mm}$ ont été relevées seulement dans la vallée du Rhône en amont de Lyon, dans la vallée de la Saône au-dessous de Chalon, sur les montagnes du Lyonnais, du Beaujolais, du Forez, d'Aubrac, au sommet du Morvan et dans le pays au nord du bassin de la Seine.

Le minimum se retrouve encore sur la Méditerranée; il se prolonge dans l'Ouest et s'étend sur les bassins du Tarn, de la Garonne et de ses affluents de la rive gauche.

Dans toute la région qui s'étend de Menton jusque vers Bordeaux, les totaux de pluie sont inférieurs à 25$^{mm}$. De faibles quantités d'eau sont encore tombées en divers points, notamment dans les bassins du Cher, de l'Indre et de la Loire inférieure.

*Septembre.* — Une dépression secondaire, qui traverse le nord de la France dans la nuit du 2 au 3, amène des pluies en Bretagne, sur la Seine inférieure et sur les petits bassins au nord de la Seine.

Le groupe de pluies le plus important du mois pour tout le pays au nord du plateau central se rattache à une dépression venue le 7 par le Portugal et dont le centre a gagné lentement l'Irlande en longeant la côte de l'Océan. Les pluies sont tombées principalement dans les bassins de la Loire et de la Seine, et sur le versant de la mer du Nord.

A partir du 13, les faibles pressions gagnent les hautes latitudes, et le beau temps persiste jusque vers le 20.

Le 21, une autre dépression secondaire, qui s'est formée vers le golfe de Gascogne, amène encore quelques pluies orageuses dans les bassins de la Loire et de la Seine. Des pluies isolées sont signalées jusqu'au 24, puis le temps redevient beau jusqu'à la fin du mois.

Le nombre des jours de pluie est de dix à quatorze sur le versant de la mer du Nord, huit à dix dans les bassins de la Seine et de la Saône, quatre à six dans les bassins de la Loire, de la Gironde et dans le cours moyen du Rhône, deux à quatre sur le littoral de la Méditerranée.

Le mois de septembre 1877 est relativement sec. On ne trouve de pluies supérieures à $100^{mm}$ que vers la source de la Sarthe et dans une région comprenant le bassin de l'Aisne, une partie de celui de la Marne et les montagnes de l'Argonne. Dans le bassin de Paris, les pluies sont comprises entre $40^{mm}$ et $60^{mm}$; elles sont plus faibles encore dans le bassin de la Loire et dans la vallée de la Saône; enfin, comme en août, les pluies sont inférieures à $25^{mm}$ dans le bassin de la Garonne, le cours inférieur du Rhône et sur les petits cours d'eau qui se jettent dans la Méditerranée.

*Carte n°* 3. — Les pluies d'été ne présentent pas avec les bourrasques une relation aussi exclusive que celles de la saison froide. Les grandes dépressions sont plus rares et moins intenses en été, et c'est pendant cette saison que le régime orageux atteint son plus grand développement. Or les pluies orageuses de l'été sont souvent localisées; par suite, les hauteurs d'eau tombées simultanément en des points voisins peuvent présenter de grandes différences. On sait, du reste, que les orages déversent quelquefois d'énormes quantités d'eau en certains points, alors que la pluie tombe à peine à peu de distance.

Cette irrégularité dans la répartition des pluies d'été pour un jour donné se retrouve dans les totaux mensuels, et il est facile d'en suivre la trace sur la Carte n° 3. Cette Carte, qui résume les observations des mois de juillet, août et septembre, ne présente pas, en effet, le même caractère de généralité que les deux précédentes; une certaine proportion des pluies de cette saison sont dues, en

effet, à des causes accidentelles, locales, qui viennent masquer la régularité du phénomène.

Les plus grandes pluies de cette période sont tombées dans les Pyrénées vers la source du gave d'Aspe (434$^{mm}$), et au col des Gets, dans la Haute-Savoie (429$^{mm}$); viennent ensuite les pluies de la région du Nord-Est, de l'Est et du bassin de la Durance. De nombreux maxima relatifs, où la pluie est supérieure à 200$^{mm}$, sont encore figurés sur la Carte.

Le minimum absolu (50$^{mm}$) longe la côte de la Méditerranée; enfin il est tombé moins de 100$^{mm}$ d'eau dans une partie du bassin de la Garonne, sur la côte de la Vendée et sur la rive droite de la Loire inférieure.

### Quatrième trimestre de 1877.

Cette saison a été la plus humide de l'année dans les bassins de l'Adour, de la Charente, de la Loire inférieure et sur les affluents (rive droite) de la Loire.

*Octobre.* — Le régime des hautes pressions reste établi sur la France jusqu'au 20, et le temps sec de la fin de septembre se continue en octobre jusque vers le 23, sauf quelques pluies légères qui se groupent autour du 9 et du 16.

A partir du 21, le courant équatorial se rapproche des côtes de l'Europe occidentale, et une série de bourrasques étendent leur action sur la France jusqu'à la fin du mois; les pluies se prolongent également pendant la même période, sauf quelques intermittences; elles sont particulièrement abondantes du 24 au 26, notamment sur le littoral de la Méditerranée.

On compte dix à douze jours de pluie sur le versant de la mer du Nord, la région du Nord-Ouest, et dans les bassins de la Seine et de la Saône, huit à dix dans le bassin de la Loire et le cours moyen du Rhône, cinq à huit dans la région du Sud-Ouest, trois ou quatre sur la Méditerranée.

Les maxima de pluie, peu supérieurs, du reste, à 100$^{mm}$, sont rares et circonscrits; on en trouve au sommet du Morvan, sur le Jura, le plateau de Gatine, la partie élevée de la Bretagne, et sur la Méditerranée vers l'embouchure du Var. Les pluies n'atteignent pas 50$^{mm}$ dans les bassins de la Seine et de la Loire (sauf dans les régions maritimes), dans les bassins de la Garonne, de la Saône, du Rhône au-dessous de Lyon; un minimum inférieur à 25$^{mm}$ se montre dans la vallée supérieure de l'Allier. Le minimum absolu se voit encore dans le bassin de l'Ariège et sur les petits bassins entre les Pyrénées et le Rhône.

*Novembre.* — Les hautes pressions et le temps sec règnent pendant les premiers jours du mois de novembre; mais, dès le 4, les faibles pressions repa-

raissent. Des bourrasques, venant de l'Océan et marchant vers le Nord-Est, se succèdent et maintiennent en France le régime des vents du Sud-Ouest; les pluies sont générales jusqu'au 13; du 8 au 12 elles sont très fortes dans la région de Nice.

Le 14, le baromètre commence à remonter et les hautes pressions persistent jusqu'au 19; le temps est plus sec pendant cette période.

A partir du 20, une nouvelle série de perturbations, d'une grande intensité, ramènent de nouveaux mauvais temps, et, sauf une courte accalmie le 26, les pluies sont générales pendant les onze derniers jours du mois.

On compte jusqu'à vingt-quatre jours de pluie dans le pays au nord du bassin de la Seine, vingt-deux dans le bassin de l'Oise, dans les bassins entre la Seine et la Loire et sur les affluents de la rive droite de la Loire, dix-huit à vingt dans la région du Sud-Ouest, seize à dix-neuf sur le versant de la mer du Nord, quatorze à seize dans les bassins de la Seine, de la Loire (rive gauche), de la Saône, dans le cours moyen du Rhône, dix à douze dans la vallée inférieure du Rhône, et cinq à sept seulement sur le littoral de la Méditerranée.

La distribution des pluies de novembre est remarquable; le maximum absolu ($249^{mm}$) se montre en Bretagne. Les fortes pluies s'étendent, à partir de la côte et jusqu'à une certaine distance dans l'intérieur, sur les versants de la Manche et de la Méditerranée. Dans l'Est, le versant oriental des bassins de la Saône et du Rhône, est également une région à fortes pluies. D'autres maxima, très limités, se montrent vers la haute Meuse, sur le Morvan et la Montagne Noire. Les bassins de la Seine au-dessus de Mantes, de la Loire en amont de Tours, de la Garonne en amont d'Agen, les vallées de la Saône et du Rhône, reçoivent des quantités de pluie comprises entre $50^{mm}$ et $100^{mm}$. Enfin, vers l'embouchure du Rhône et sur les petits bassins entre ce fleuve et les Pyrénées, les hauteurs totales d'eau recueillies en novembre sont restées inférieures à $25^{mm}$.

*Décembre.* — Le temps pluvieux de la dernière partie du mois de novembre se continue en décembre jusque vers le 8. A cette date le baromètre remonte et des pressions élevées persistent jusqu'au 11. Le 12, une bourrasque, dont le centre passe au nord de l'Écosse, étend son action jusqu'à nos régions et amène des pluies générales en France, dans les journées du 12 et du 13.

Les hautes pressions réapparaissent le 14 et persistent jusqu'au 22.

Enfin un groupe de bourrasques qui se succèdent du 24 au 31 ramènent, pendant cette dernière période, des pluies qui s'étendent à toutes nos régions.

Le nombre des jours de pluie est de vingt à vingt-quatre en Bretagne, dix-huit à vingt dans le bassin de la Seine et dans les petits bassins du Nord, seize à vingt dans les bassins de la Loire et de la Saône, quatorze à seize sur le versant de la mer du Nord et dans le cours moyen du Rhône, douze à quatorze dans les bassins

de la Garonne et de l'Adour, dix à douze dans le bassin de l'Aude, quatre à six dans le cours inférieur du Rhône et dans les petits bassins entre le Rhône et les Alpes.

Les plus grandes quantités d'eau sont tombées sur les Vosges, le plateau de Langres, le Morvan, le Jura, dans les bassins de l'Adour et de la haute Garonne, sur le versant occidental du plateau central, dans le bassin de la Charente, sur la côte de l'Océan au nord de la Rochelle, vers la source de la Mayenne et l'embouchure de la Seine. Les moindres totaux se trouvent dans la vallée du haut Allier, sur le cours inférieur du Rhône, dans les bassins de l'Hérault, de la Durance, et dans les petits bassins situés entre le Rhône et les Alpes. Dans ces diverses régions, la pluie n'a pas atteint une épaisseur de $25^{mm}$.

*Carte n°* 4. — Le maximum absolu de pluie tombée pendant les trois mois d'octobre, novembre et décembre, a été relevé dans les Basses-Pyrénées ($854^{mm}$). On trouve des totaux de $626^{mm}$ au sommet du Morvan, $494^{mm}$ sur les collines de Bretagne, $445^{mm}$ sur la Montagne Noire, $435^{mm}$ sur le Jura, $416^{mm}$ sur les Vosges. Des maxima inférieurs à $400^{mm}$ se montrent encore sur les collines de l'Artois et de la Normandie, sur la côte de l'Océan, sur le versant occidental du plateau central, sur le plateau de Lannemezan, les montagnes du Forez, le plateau de Langres.

Sur une vaste région, qui comprend le bassin de Paris et la plus grande partie du bassin de la Loire au-dessus de Tours, les totaux de pluie sont compris entre $100^{mm}$ et $200^{mm}$; il en est de même dans le bassin moyen de la Garonne, et dans les vallées de la Saône et du Rhône.

Des maxima, où la quantité d'eau recueillie est inférieure à $100^{mm}$, se montrent encore dans la vallée du haut Allier, sur les petits bassins des Pyrénées orientales et vers l'embouchure du Rhône.

### Résumé.

Si l'on excepte la côte de la Méditerranée, le cours inférieur du Rhône et quelques points du bassin de la Loire, les pluies, en France, sont en excès marqué sur la moyenne: l'année 1877 est une année humide dans presque tout le pays situé au nord du Plateau central; dans les Pyrénées-Orientales, au contraire, le total annuel de la pluie tombée est de beaucoup inférieur à la moyenne normale.

*Carte n°* 5. — La Carte n° 5 résume les hauteurs totales de pluie tombées en France pendant l'année 1877; elle met nettement en relief les influences qui déterminent la distribution des pluies.

Les plus grandes hauteurs d'eau tombées atteignent $2209^{mm}$ sur les basses

Pyrénées, vers la source du gave d'Aspe, et 2181$^{mm}$ au Haut-Follin, au sommet du Morvan. Mais les zones pluvieuses les plus étendues se rencontrent dans l'est; sur les Vosges, le Jura, les Alpes de la Savoie, la quantité de pluie est de beaucoup supérieure à 1000$^{mm}$, atteignant jusqu'à 1670$^{mm}$ à Pontarlier, 1815$^{mm}$ à Thônes, 1947$^{mm}$ à Ambérieu. Des maxima relatifs se montrent encore sur le plateau de Langres, les monts du Forez, du Beaujolais, le versant occidental du plateau central, les monts de la Lozère et la Montagne Noire; d'autres encore, dus principalement au voisinage de la mer, se remarquent en Bretagne (1500$^{mm}$), sur les collines de la Normandie (1307$^{mm}$), sur le plateau de Gatine (1013$^{mm}$) et vers la source de la Sarthe (1144$^{mm}$).

Dans le bassin de Paris et dans toute la région moyenne du bassin de la Loire, les hauteurs de pluie sont inférieures à 800$^{mm}$; dans la vallée du haut Allier elles n'atteignent pas 600$^{mm}$. Des minima relatifs existent également dans les vallées du Rhin, de la Saône, de la haute Loire, de la Garonne, du Rhône inférieur. La région du minimum absolu, avec des hauteurs de pluie inférieures à 400$^{mm}$, s'étale le long de la côte méditerranéenne, depuis les Pyrénées orientales jusqu'au delà de Toulon; à Perpignan il n'en est tombé que 228$^{mm}$.

La Carte annuelle montre, à première vue, que les points culminants reçoivent constamment plus de pluie que les lieux environnants situés à une altitude plus faible; les régions basses, les plaines, correspondent aux moindres chutes de pluie. Les maxima des collines de l'Artois, de la Normandie, de la Bretagne et du Poitou, sont dus principalement à la proximité de ces provinces à l'est d'une grande masse d'eau; cette influence agit en raison de la fréquence des vents d'Ouest, qui chassent vers ces régions l'air humide de l'Océan, et c'est pendant la saison froide qu'elle se manifeste avec le plus de netteté. Le maximum du golfe de Gascogne est la conséquence de la prédominance des vents humides de l'Ouest ou du Nord-Ouest; de même les pluies du Sud et du Sud-Est dans le bassin inférieur du Rhône, sont retenues sur le versant méditerranéen et expliquent le maximum des montagnes de l'Ardèche.

Dans les pays montagneux, à altitude égale, les pluies sont le plus abondantes sur le versant exposé à l'action directe des vents humides. Lorsqu'une masse d'air s'élève le long de la pente d'une montagne, elle se refroidit progressivement, son état hygrométrique augmente, et les nuages condensent bientôt l'excès d'humidité dont ils sont chargés; cette condensation est d'autant plus active que la différence des températures est plus grande et que l'air venu de la plaine était d'abord plus voisin de son point de saturation. Le phénomène inverse se produit sur l'autre versant : en descendant la pente opposée à la direction du vent, l'air se réchauffe et s'éloigne de son point de rosée; la pluie est faible et quelquefois nulle. C'est ainsi qu'une très forte proportion des pluies amenées par les vents d'Ouest sur le plateau de Langres et le haut Morvan se déversent

dans le bassin de la Seine, et que s'expliquent les minima de la vallée de la Saône, et de la vallée du Rhin entre Bâle et Strasbourg. Il en est de même encore du minimum de la vallée supérieure de l'Allier, laquelle est abritée des vents de l'Est par les montagnes du Forez, des vents du Sud par les monts d'Aubrac et les monts de la Lozère, des vents de l'Ouest par les monts d'Auvergne ; découverte seulement du côté du Nord, elle n'est accessible qu'aux vents de cette direction, qui sont habituellement secs.

(1) Les nombres des Laubies sont beaucoup trop faibles.

(2) Le nombre inscrit à la date du 31 représente la hauteur de l'eau tombée sous forme de neige pendant la deuxième quinzaine de janvier.
